

公式推导

1. 波动方程的推导:

$$\text{麦克斯韦方程组: } \begin{cases} \nabla \cdot \vec{D} = 0 & \dots \textcircled{1} \\ \nabla \cdot \vec{B} = 0 & \dots \textcircled{2} \\ \nabla \times \vec{E} = -\frac{\partial \vec{B}}{\partial t} & \dots \textcircled{3} \\ \nabla \times \vec{H} = \frac{\partial \vec{D}}{\partial t} & \dots \textcircled{4} \end{cases}$$

$$\text{物质方程: } \begin{cases} \vec{D} = \epsilon \vec{E} \\ \vec{B} = \mu \vec{H} \\ \vec{J} = \sigma \vec{E} \end{cases}$$

$$\text{对 } \textcircled{3} \text{ 式左右取旋度: } \nabla \times (\nabla \times \vec{E}) = \nabla \times \left(-\frac{\partial \vec{B}}{\partial t} \right) = -\frac{\partial}{\partial t} (\nabla \times \vec{B}) = -\mu \frac{\partial^2 \vec{D}}{\partial t^2} = -\mu \epsilon \frac{\partial^2 \vec{E}}{\partial t^2}$$

$$\text{由矢量微分恒等式: } \nabla \times (\nabla \times \vec{A}) = \nabla (\nabla \cdot \vec{A}) - \nabla^2 \vec{A} \text{ 得.}$$

$$\nabla \times (\nabla \times \vec{E}) = \nabla (\nabla \cdot \vec{E}) - \nabla^2 \vec{E} = -\nabla^2 \vec{E}$$

$$\text{故: } \nabla^2 \vec{E} - \mu \epsilon \frac{\partial^2 \vec{E}}{\partial t^2} = 0$$

$$\text{同理可得: } \nabla^2 \vec{H} - \mu \epsilon \frac{\partial^2 \vec{H}}{\partial t^2} = 0$$

$$\text{若令 } v = \frac{1}{\sqrt{\mu \epsilon}}$$

$$\text{则: } \begin{cases} \nabla^2 \vec{E} - \frac{1}{v^2} \frac{\partial^2 \vec{E}}{\partial t^2} = 0 \\ \nabla^2 \vec{H} - \frac{1}{v^2} \frac{\partial^2 \vec{H}}{\partial t^2} = 0 \end{cases}$$

2. 相速度公式推导:

$$\text{假设单色光波电场的表示式为: } E = E_0 \cos[(\omega t - \varphi(r))]$$

$$\omega t - \varphi(r) = \text{常量}$$

$$\text{对时间求导数得: } \omega dt - \nabla \varphi \cdot d\vec{r} = 0$$

$$\text{设 } r_0 \text{ 为 } d\vec{r} \text{ 方向上的单位矢量, 并写成 } d\vec{r} = r_0 ds$$

$$\text{则有: } \frac{ds}{dt} = \frac{\omega}{r_0 \cdot \nabla \varphi} \Rightarrow v(r) = \frac{\omega}{r_0 \cdot \nabla \varphi}$$

$$\text{对于波矢量为 } \vec{k} \text{ 的平面单色光波, 其空间相位项为: } \varphi(r) = \vec{k} \cdot \vec{r} - \varphi_0$$

$$\text{因此: } \nabla \varphi = \vec{k}$$

$$\text{故 } v(r) = \frac{\omega}{k} = \frac{c}{n \mu_r \epsilon_r}$$

3. 群速度推导. 证明: $v_g = \frac{c}{n + \omega \frac{dn}{d\omega}}$

$$v_g = \frac{d\omega}{dk} = \frac{d(\frac{c}{n})}{dk} = \frac{c}{n} + k \cdot \frac{dv}{dk}$$

$$\frac{dv}{dk} = \frac{dv}{d\omega} \cdot \frac{d\omega}{dk} = v_g \cdot \frac{dv}{d\omega}$$

$$\text{对于 } v = \frac{c}{n} \text{ 则 } \frac{dv}{d\omega} = \frac{dv}{dn} \cdot \frac{dn}{d\omega} = -\frac{c}{n^2} \cdot \frac{dn}{d\omega}$$

$$\therefore v_g = \frac{c}{n} - \frac{c k v}{n^2} \frac{dn}{d\omega} = \frac{v}{1 + \frac{c k}{n^2} \frac{dn}{d\omega}} = \frac{c}{n + \omega \frac{dn}{d\omega}}$$
